

## EZLog tutorial

1. Open your solution or project in Visual Studio IDE,  
and then select:

[Tools] > [Library Package Manager] > [Manage NuGet Packages for Solution]

2. Search for “EZLog” package.

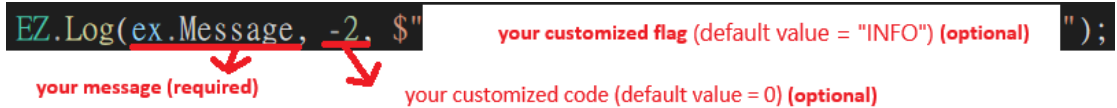

3. Use the namespace “EZLog” in the package with the identical name.

```
using EZLog;
```

4. Call the static method.

```
EZ.Log(ex.Message, -2, $"your customized flag (default value = "INFO") (optional)");
```

And the last two parameters/arguments are optional.

```
EZ.Log("TEST");
```

The log info is like:

```
[0 : INFO]
your message
= 2024/09/26T11:55:29.445864 (UTC : 2024/09/26T03:55:29.445864) =
```

The path to the folder/directory for log files is ".\\EZLOG" by default.

And you can replace it with any path you want.

```
EZ.LogDirPath = ".\\MyLog";
```
